

Case study

TATRA TRUCKS has been using Infor solutions since 1998

Just sey it like

1 200

of TATRA custom vehicles is processed annually
in the information system

5 000

of items is planned in the IS for each
manufactured vehicle

10 000

of open orders is rescheduled daily over the
course of a month

Key requirement

The increase in production required the modernization of the information system

The company TATRA TRUCKS a.s. owning the TATRA brand decided to innovate its corporate information system to support its rapid economic development. A significant increase in production and the application of modern business process management methods required a radical strengthening of the information system, especially in the areas of production planning and management, logistics management and work performance.

The implementation story

The supplier of solutions on the Infor LN platform is the Seyfor company, with which TATRA has been cooperating since 1998. The new corporate information system Infor ERP LN is based on the proven and reliable ERP system Baan IV, which TATRA has used for many years.

The implementation of the Infor LN information system was preceded by a detailed analysis, which was primarily focused on the new process and functional organization of the company and the use of innovative functions that this modern application offers. Great attention was paid to the optimization of warehouse processes, more precise planning and linkage to other systems (stacker warehouses, electronic communication with suppliers, shipment support, linkage to CAD).

The management of TATRA TRUCKS requested to minimize the time during which the operation of the IS will be interrupted during the start-up of the new solution. The representatives of the supplier and TATRA TRUCKS jointly prepared the start-up plan to the minute. Thanks to perfect cooperation on both sides, the system's launch into sharp operation succeeded exactly as planned.

„Over time, we can clearly see that our efforts have paid off. After more than a year of experience working in the new system, I can say that our choice was correct. The new information system helps us significantly in daily routine activities, it manages with an overview what our old system was no longer sufficient for and provides effective support for long-term goals in the development of our company.“

Ing. Pavel Očkovič

Head of the Information Technology Department

Result

The information system is an effective aid in constantly increasing production

The new solution fundamentally improves the work of users, speeds up and makes the transmission of information important for business management more accurate. The change in the information system is not only the biggest IT investment of TATRA TRUCKS in recent years, but above all a decisive step on the way to a modern and efficiently managed company. The basic goals of the Infor LN implementation were achieved. Production at TATRA TRUCKS is growing, and today the new information system provides the necessary support for this.

"We chose the new Infor LN information system mainly for its indisputable advantages when applied in the production sphere, but also due to long-term satisfaction with our supplier – Seyfor."

Ing. Pavel Očkovič

Head of the Information Technology Department

Main benefits

The information system records the complete production documentation of each manufactured vehicle

We know the true cost of each production order

We can automatically schedule all items of multi-level BOMs
